# Lô! — How What's Trending Works

From public sources to verified local recommendations

Ho Chi Minh City • Hanoi • Da Nang

## 1 Collect public sources

- Vietnam Nightlife
- Ticketbox
- Hanoi Grapevine
- Danang Fantasticity
- VnExpress
- TicketGo

Python HTTP collectors + browser rendering

## 2 Normalize the facts

- Canonical source URL
- Venue + city evidence
- Dates + individual sessions
- Vietnamese display text
- Image permissions + timestamps

## 3 Validate before publishing

- Supported city + real destination
- Events: next 7 days, including ongoing
- Places: mentions from past 7 days
- Reject cancellations and date conflicts
- Hold unresolved sessions

Rejected → reason logged

Verified only

## 4 Store + update

PostgreSQL

- Stable IDs + safe upserts
- Deduplicate; retain source evidence
- Match existing Lô places confidently
- Partial failures preserve valid records

Items • occurrences • observations • run receipts

## 5 Serve eligible results

API

**GET /discover/trending**

city_slug • kind • limit

- Rank independent recent mentions
- Then engagement growth + freshness
- Alternate events and places
- Hide unverified items after 72 hours
- Remove ended events

Only after checks

## 6 Render the app

- Matched place → venue screen
- Every item → original source
- Permitted image or neutral placeholder
- Loading • retry • empty states

## Optional discovery — gated

- SerpAPI: ≤200 searches/month, verified included allowance
- Bright Data: ≤4,500 credits/month, free-only checks + quota reservation
- Facebook • TikTok • Instagram: publication DISABLED pending quality validation
- Apify: alternative only; no automatic fallback

## Refresh loop

- Manual collection works now
- Planned: GitHub Actions daily at 06:00 Vietnam time — SCHEDULE NOT ENABLED
- Re-fetch sources → validate → upsert → next UI fetch shows updates

ⓘ UI reads stored data, not scraping during page load.

**Free-only. No fabricated cards. External popularity stays separate from Lô ratings.**

Current implementation • validated locally • no production deployment
